

Final Project Proposal

Ly Nguyen

The idea of the project is to make a clock in the form of hh : mm : ss (hours, minutes seconds). The functionality would be to work like a standard clock, so hours are from 1:00 → 12:00, with minutes and seconds being from 00 → 59. Additional ideas or implementations that I thought of are: an alarm system (trigger some indicator at a designated time), a timer system, and/or a stopwatch system.
